Department of Eye and Vision Science

29 May 2013

MERSEY POSTGRADUATE TRAINING PROGRAMME

Workshop Series: Basic Statistics for Eye Researchers and Clinicians

How to compare several groups?

- Research question
 - Is Visual Acuity same across three patients groups e.g. diabetic retinopathy, diabetic maculopathy and healthy?
 - Is the degree of staining in conjunctival tissues same across 5 different storage methods?
 - Is contrast sensitivity different at two different time points e.g. before and after a treatment?

- A strategy
 - To collect data on samples in each group
 - Then use the data to compare the groups via an appropriate data analysis method

Comparisons of two groups

Type of Data

Categorical

e.g. Color blindness yes/no
Or 2 severity grades of
diabetic maculopathy

Continuous Normal

Continuous Skewed

Tests for differences, independent data:

Chi-square χ^2 test

Fisher's exact test

t-test

Mann-Whitney U
test

Tests for differences, non-independent (paired) data:

McNemar's test

Paired (single sample) t-test

Wilcoxon signed
rank test

Comparisons of three (or more) groups

Type of Data

Categorical

e.g. 3 severity grades of diabetic maculopathy and 3 categories of age

Continuous Normal

Continuous Skewed

Tests for differences, independent data:

Chi-square χ^2 test

Fisher's exact test

ANOVA

& post-hoc
analyses via
two-sample
t-test

Kruskal-Wallis

& post-hoc
analyses with
Mann-Whitney U
test

Outline

- Comparison for 2 groups using data that are continuous, paired (non-independent) and skewed (not-Normal)
 - Wilcoxon test
- Comparisons for 2 groups using data that are continuous, independent and skewed (not-Normal)
 - Mann-Whitney's test

Nonparametric methods of groups comparison for continuous data

- Parametric methods (such as t-test, ANOVA) for continuous (interval) data assume response measurement is approximately Normally distributed. Assumption may not be justifiable, or difficult to check because of small amount of data.
- **Nonparametric** (or **distribution-free**) techniques do not require the Normality assumption where numerical data are replaced by rank values.

For paired continuous data: **Wilcoxon signed rank**

For independent continuous data: **Mann-Whitney U test**

Wilcoxon signed rank test

- The non-parametric equivalent of the paired (one sample) *t*-test is the *Wilcoxon signed rank test*.
- For n pairs of observations the procedure is:
 - Calculate the difference between the pairs of observations.
 - Rank the differences in order of magnitude, ignoring the signs.
 - Sum the ranks of the negative differences to give T^- and those of the positive differences to give T^+
 - Set T to be the smaller of T^- and T^+
- The distribution of T is tabulated for $n < 50$. A normal approximation can be used for large n .

Example: Visual acuity and Wilcoxon signed rank test

- 13 patients of early diabetic retinopathy are seen twice: at a baseline and at six months.
- Has their visual acuity (BCVA in letters) changed across the two time point?

Null hypothesis

H0: The distribution of BCVA is same
at the two time points.

Alternative hypothesis

H1: the distribution is different

Data are too short to check Normality,
so we will use Wilcoxon test.

Example: Visual acuity and Wilcoxon signed rank test

| BCVAbaseline | BCVAat6months | Difference | Abs Diff | Rank | Rank + | Rank - |
|--------------|---------------|------------|----------|------|--------|--------|
| 94 | 93 | 1 | | | | |
| 90 | 95 | -5 | | | | |
| 90 | 84 | 6 | | | | |
| 81 | 85 | -4 | | | | |
| 70 | 80 | -10 | | | | |
| 85 | 83 | 2 | | | | |
| 87 | 79 | 8 | | | | |
| 82 | 75 | 7 | | | | |
| 86 | 95 | -9 | | | | |
| 73 | 84 | -11 | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

1 step Calculate the difference between the pairs of observations.

Example: Visual acuity and Wilcoxon signed rank test

| BCVAbaseline | BCVAat6months | Difference | Abs Diff | Rank | Rank + | Rank - |
|--------------|---------------|------------|----------|------|--------|--------|
| 94 | 93 | 1 | 1 | 1 | | |
| 90 | 95 | -5 | 5 | 4 | | |
| 90 | 84 | 6 | 6 | 5 | | |
| 81 | 85 | -4 | 4 | 3 | | |
| 70 | 80 | -10 | 10 | 9 | | |
| 85 | 83 | 2 | 2 | 2 | | |
| 87 | 79 | 8 | 8 | 7 | | |
| 82 | 75 | 7 | 7 | 6 | | |
| 86 | 95 | -9 | 9 | 8 | | |
| 73 | 84 | -11 | 11 | 10 | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

2 step Rank the differences in order of magnitude, ignoring the signs.

Example: Visual acuity and Wilcoxon signed rank test ... manually

| BCVAbaseline | BCVAat6months | Difference | Abs Diff | Rank | Rank + | Rank - |
|----------------|---------------|------------|----------|------|--------|--------|
| 94 | 93 | 1 | 1 | 1 | 1 | |
| 90 | 95 | -5 | 5 | 4 | | 4 |
| 90 | 84 | 6 | 6 | 5 | 5 | |
| 81 | 85 | -4 | 4 | 3 | | 3 |
| 70 | 80 | -10 | 10 | 9 | | 9 |
| 85 | 83 | 2 | 2 | 2 | 2 | |
| 87 | 79 | 8 | 8 | 7 | 7 | |
| 82 | 75 | 7 | 7 | 6 | 6 | |
| 86 | 95 | -9 | 9 | 8 | | 8 |
| 73 | 84 | -11 | 11 | 10 | | 10 |
| | | | | SUM | 21 | 34 |
| Here T- equals | 34 | | | | | |
| Here T+ equals | 21 | | | | | |

Step 3 Find ranks in each group: Rank + and Rank-; and sum them up.

Example: Visual acuity and Wilcoxon signed rank test ... manually

| BCVAbaseline | BCVAat6months | Difference | AbsDiff | Rank | Rank ⁺ | Rank ⁻ |
|--------------|---------------|------------|---------|------|-------------------|-------------------|
| 94 | 93 | 1 | 1 | 1 | 1 | |
| 90 | 95 | -5 | 5 | 4 | | 4 |
| 90 | 84 | 6 | 6 | 5 | 5 | |
| 81 | 85 | -4 | 4 | 3 | | 3 |
| 70 | 80 | -10 | 10 | 9 | | 9 |
| 85 | 83 | 2 | 2 | 2 | 2 | |
| 87 | 79 | 8 | 8 | 7 | 7 | |
| 82 | 75 | 7 | 7 | 6 | 6 | |
| 86 | 95 | -9 | 9 | 8 | | 8 |
| 73 | 84 | -11 | 11 | 10 | | 10 |
| | | | | SUM | 21 | 34 |

Step 4 Test statistic.

Here T^- equals 34
 Here T^+ equals 21

- Hence test statistic $T = \min(T^- \text{ and } T^+) = 21$
- Under hypothesis of equality of distributions at 0 and 6 months, what value of T we expect ?
 - (a) Small and close to 0 ?
 - (b) Large and close to max rank which is 55 ?
 - (b) Or the average value of 1, 2, 3, ..., 10 which is $55/2 = 27.5$?

Example: Visual acuity and Wilcoxon signed rank test

| BCVAbaseline | BCVAat6months | Difference | AbsDiff | Rank | Rank ⁻ | Rank ⁺ |
|--------------|---------------|------------|---------|------|-------------------|-------------------|
| 94 | 93 | 1 | 1 | 1 | 1 | |
| 90 | 95 | -5 | 5 | 4 | | 4 |
| 90 | 84 | 6 | 6 | 5 | 5 | |
| 81 | 85 | -4 | 4 | 3 | | 3 |
| 70 | 80 | -10 | 10 | 9 | | 9 |
| 85 | 83 | 2 | 2 | 2 | 2 | |
| 87 | 79 | 8 | 8 | 7 | 7 | |
| 82 | 75 | 7 | 7 | 6 | 6 | |
| 86 | 95 | -9 | 9 | 8 | | 8 |
| 73 | 84 | -11 | 11 | 10 | | 10 |
| | | | | SUM | 21 | 34 |

Here T^- equals 34

Here T^+ equals 21

- Hence test statistic $T = \min(T^- \text{ and } T^+) = 21$
- Under hypothesis of equality of distributions at 0 and 6 months, what value of T we expect?
 - (a) Small and close to 0 ? **NO**
 - (b) Large and close to max rank which is 55 ? **NO**
 - (b) Or the average value of 1, 2, 3, ..., 10 which is $55/2=27.5$? **YES**

Example: Visual acuity and Wilcoxon signed rank test

| BCVAbaseline | BCVAat6months | Difference | Abs Diff | Rank | Rank ⁻ | Rank ⁺ |
|--------------|---------------|------------|----------|------|-------------------|-------------------|
| 94 | 93 | 1 | 1 | 1 | 1 | |
| 90 | 95 | -5 | 5 | 4 | | 4 |
| 90 | 84 | 6 | 6 | 5 | 5 | |
| 81 | 85 | -4 | 4 | 3 | | 3 |
| 70 | 80 | -10 | 10 | 9 | | 9 |
| 85 | 83 | 2 | 2 | 2 | 2 | |
| 87 | 79 | 8 | 8 | 7 | 7 | |
| 82 | 75 | 7 | 7 | 6 | 6 | |
| 86 | 95 | -9 | 9 | 8 | | 8 |
| 73 | 84 | -11 | 11 | 10 | | 10 |
| SUM | | | | | 21 | 34 |

Here T^- equals
Here T^+ equals

34
21

- Hence test statistic $T = \min(T^- \text{ and } T^+) = 21$
- Is value 21 small enough to reject H_0 ?
- The 5% quantile of Wilcoxon test is **8** (from stats tables) i.e. we would reject null hypothesis of equality if $T \leq 8$.
- **Conclusion? Do we reject null hypothesis of equality of BCVA distribution across the two time points?**

Example: Visual acuity and Wilcoxon signed rank test

| BCVAbaseline | BCVAat6months | Difference | Abs Diff | Rank | Rank ⁻ | Rank ⁺ |
|--------------|---------------|------------|----------|------|-------------------|-------------------|
| 94 | 93 | 1 | 1 | 1 | 1 | |
| 90 | 95 | -5 | 5 | 4 | | 4 |
| 90 | 84 | 6 | 6 | 5 | 5 | |
| 81 | 85 | -4 | 4 | 3 | | 3 |
| 70 | 80 | -10 | 10 | 9 | | 9 |
| 85 | 83 | 2 | 2 | 2 | 2 | |
| 87 | 79 | 8 | 8 | 7 | 7 | |
| 82 | 75 | 7 | 7 | 6 | 6 | |
| 86 | 95 | -9 | 9 | 8 | | 8 |
| 73 | 84 | -11 | 11 | 10 | | 10 |
| | | | | SUM | 21 | 34 |

Here T^- equals
Here T^+ equals

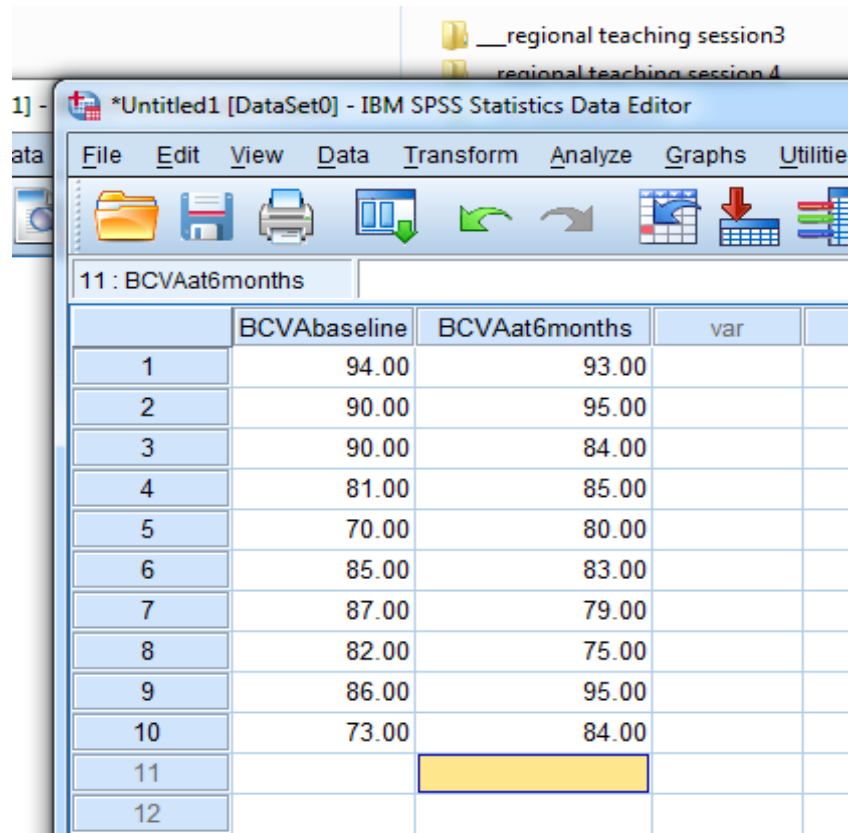

34
21

- Hence test statistic $T = \min(T^- \text{ and } T^+) = 21$
- Is value 21 small enough to reject H_0 ?
- The 5% quantile of Wilcoxon test is **8** (from stats tables) i.e. we would reject null hypothesis of equality if $T \leq 8$.
- **Conclusion? Do we reject null hypothesis of equality of distribution of BCVA across the two time points? The answer is "NO"**

Example: Visual acuity and Wilcoxon test manually

- From statistics tables the 5% quantile (critical value) is 8, hence $T > 8$ i.e. $21 > 8$, hence the result is NOT significant at the 5% significance level.
- The conclusion is that we do not have strong evidence of change in BCVA across the 6 months.
- Note that:
 - Zero differences are discounted and n is *decreased accordingly*.
 - Tied values are assigned the average of the ranks covered.

Wilcoxon test in SPSS software: data supplied in two columns

The screenshot displays the IBM SPSS Statistics Data Editor interface. The title bar indicates the file is named '*Untitled1 [DataSet0]'. The menu bar includes File, Edit, View, Data, Transform, Analyze, Graphs, and Utilities. The toolbar contains icons for file operations and data manipulation. The active window is titled '11 : BCVAat6months'. The data is presented in a table with the following columns: 'BCVAbaseline', 'BCVAat6months', and 'var'. The rows are numbered 1 through 12. Row 11 is highlighted in yellow.

| | BCVAbaseline | BCVAat6months | var |
|----|--------------|---------------|-----|
| 1 | 94.00 | 93.00 | |
| 2 | 90.00 | 95.00 | |
| 3 | 90.00 | 84.00 | |
| 4 | 81.00 | 85.00 | |
| 5 | 70.00 | 80.00 | |
| 6 | 85.00 | 83.00 | |
| 7 | 87.00 | 79.00 | |
| 8 | 82.00 | 75.00 | |
| 9 | 86.00 | 95.00 | |
| 10 | 73.00 | 84.00 | |

Wilcoxon test in SPSS software: defining variables

The screenshot shows the IBM SPSS Statistics Data Editor interface. The main window displays a data grid with two columns: 'BCVAbaseline' and 'BCVAat6months'. The data points are as follows:

| Row | BCVAbaseline | BCVAat6months |
|-----|--------------|---------------|
| 1 | 94.00 | 93.00 |
| 2 | 90.00 | 95.00 |
| 3 | 90.00 | 84.00 |
| 4 | 81.00 | 85.00 |
| 5 | 70.00 | 80.00 |
| 6 | 85.00 | 83.00 |
| 7 | 87.00 | 79.00 |
| 8 | 82.00 | 75.00 |
| 9 | 86.00 | 95.00 |
| 10 | 73.00 | 84.00 |
| 11 | | |
| 12 | | |
| 13 | | |
| 14 | | |
| 15 | | |
| 16 | | |
| 17 | | |
| 18 | | |
| 19 | | |
| 20 | | |
| 21 | | |
| 22 | | |

The 'Two-Related-Samples Tests' dialog box is open, showing the following configuration:

- Test Pairs:**

| Pair | Variable1 | Variable2 |
|------|--------------|---------------|
| 1 | BCVAbaseline | BCVAat6months |
| 2 | | |
- Test Type:**
 - Wilcoxon
 - Sign
 - McNemar
 - Marginal Homogeneity

The dialog box also includes buttons for 'Exact...', 'Options...', 'OK', 'Paste', 'Reset', 'Cancel', and 'Help'.

Wilcoxon test in SPSS software: results

Wilcoxon Signed Ranks Test

| | | Ranks | | |
|------------------------------|----------------|----------------|-----------|--------------|
| | | N | Mean Rank | Sum of Ranks |
| BCVAat6months - BCVAbaseline | Negative Ranks | 5 ^a | 4.20 | 21.00 |
| | Positive Ranks | 5 ^b | 6.80 | 34.00 |
| | Ties | 0 ^c | | |
| | Total | 10 | | |

a. BCVAat6months < BCVAbaseline

b. BCVAat6months > BCVAbaseline

c. BCVAat6months = BCVAbaseline

| Test Statistics ^a | |
|------------------------------|------------------------------|
| | BCVAat6months - BCVAbaseline |
| Z | -.663 ^b |
| Asymp. Sig. (2-tailed) | .508 |

a. Wilcoxon Signed Ranks Test

b. Based on negative ranks.

From SPSS: p-value 0.508.

Do we reject null hypothesis at 5% significance level?

The conclusion is that we do not have strong evidence of change in BCVA across the 6 months.

Non-parametric group-comparison test for independent continuous non-Normal data

- Suppose we have two groups of individuals, with n_1 in the first group and n_2 in the second.
- We observe a response measurement for each individual in each group and wish to compare the measurements between the two groups.
- If response cannot be assumed to be normally distributed: means (or, the difference in means) are not an adequate summary of the data.

Example: Contrast sensitivity

- Contrast sensitivity (CS, in letters) was measured on 6 normal healthy subjects and 7 subjects with diabetic maculopathy ($n_1 = 6$, $n_2 = 7$).
- The distributions in each group are skewed, so a non-parametric test is preferable to the two-sample *t*-test:

| Normals | DM |
|---------|----|
| CS | CS |
| 38 | 24 |
| 39 | 25 |
| 40 | 25 |
| 42 | 27 |
| 42 | 35 |
| 42 | 37 |
| | 41 |

Mann-Whitney U test

For two distinct groups, we use the **Mann-Whitney U test** and proceed as follows:

- Rank all the measurements (from low to high)
- To those ranks that are tied assign the average of the tied ranks.
- Sum the ranks of group 1, giving T_1
- Calculate $U_1 = n_1 n_2 + \frac{1}{2} n_1(n_1 + 1) - T_1$ and $U_2 = n_1 n_2 - U_1$
- Set U to be the smaller of U_1 and U_2
- The distribution of U is tabulated for n_1 and n_2 less than 20. For larger values of n , a normal approximation can be used.

Example: Contrast Sensitivity

- We are interested if there is a difference between normal healthy subjects and subjects with diabetic maculopathy in terms of contrast sensitivity.

| Normals | DM |
|---------|----|
| CS | CS |
| 38 | 24 |
| 39 | 25 |
| 40 | 25 |
| 42 | 27 |
| 42 | 35 |
| 42 | 37 |
| | 41 |

H0: healthy and diabetic maculopathy subjects have same distribution of contrast sensitivity

H1: the distributions are different

We shall use Mann-Whitney U test because of independent continuous data, and because data are skewed.

Example: Contrast Sensitivity and Mann-Whitney U test

| Normals | DM | Normals | DM |
|---------|----|---------|-------|
| CS | CS | Ranks | Ranks |
| 38 | 24 | 7 | 1 |
| 39 | 25 | 8 | 2.5 |
| 40 | 25 | 9 | 2.5 |
| 42 | 27 | 12 | 4 |
| 42 | 35 | 12 | 5 |
| 42 | 37 | 12 | 6 |
| | 41 | | 10 |

Total T1= 60
 Total T2= 31
 n1= 6
 n2= 7
 U1= 3
 U2= 39

Test statistic $U = \text{smaller of } U1 \text{ and } U2 = 3$

From stats tables the quantile (critical value) is = 6

Example: Contrast Sensitivity and Mann-Whitney U test

- Remember that tied values are assigned the average of the ranks covered.
- Thus here:

$$U_1 = n_1 n_2 + \frac{1}{2} n_1(n_1 + 1) - T_1 = 6 \times 7 + \frac{1}{2} \times 6 \times 7 - 60 = 3$$

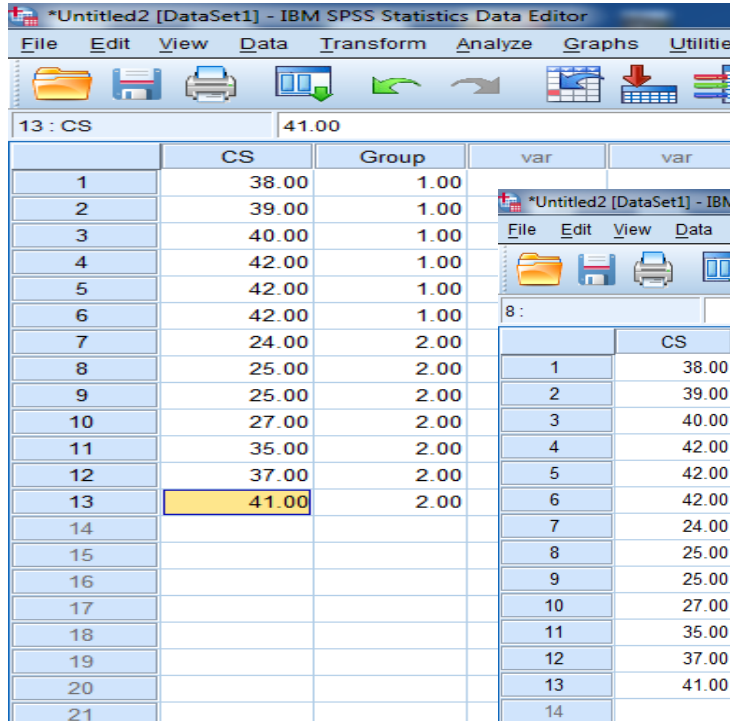

$$U_2 = n_1 n_2 - U_1 = 6 \times 7 - 3 = 39$$

- Test statistic $U = \min(U_1, U_2) = 3$
- From tables, we have quantile (critical value of 6), hence it is seen that the result is significant at the 5% significance level, because $U < 6$.

There is strong evidence to suggest that contrast sensitivity differs between the two groups.

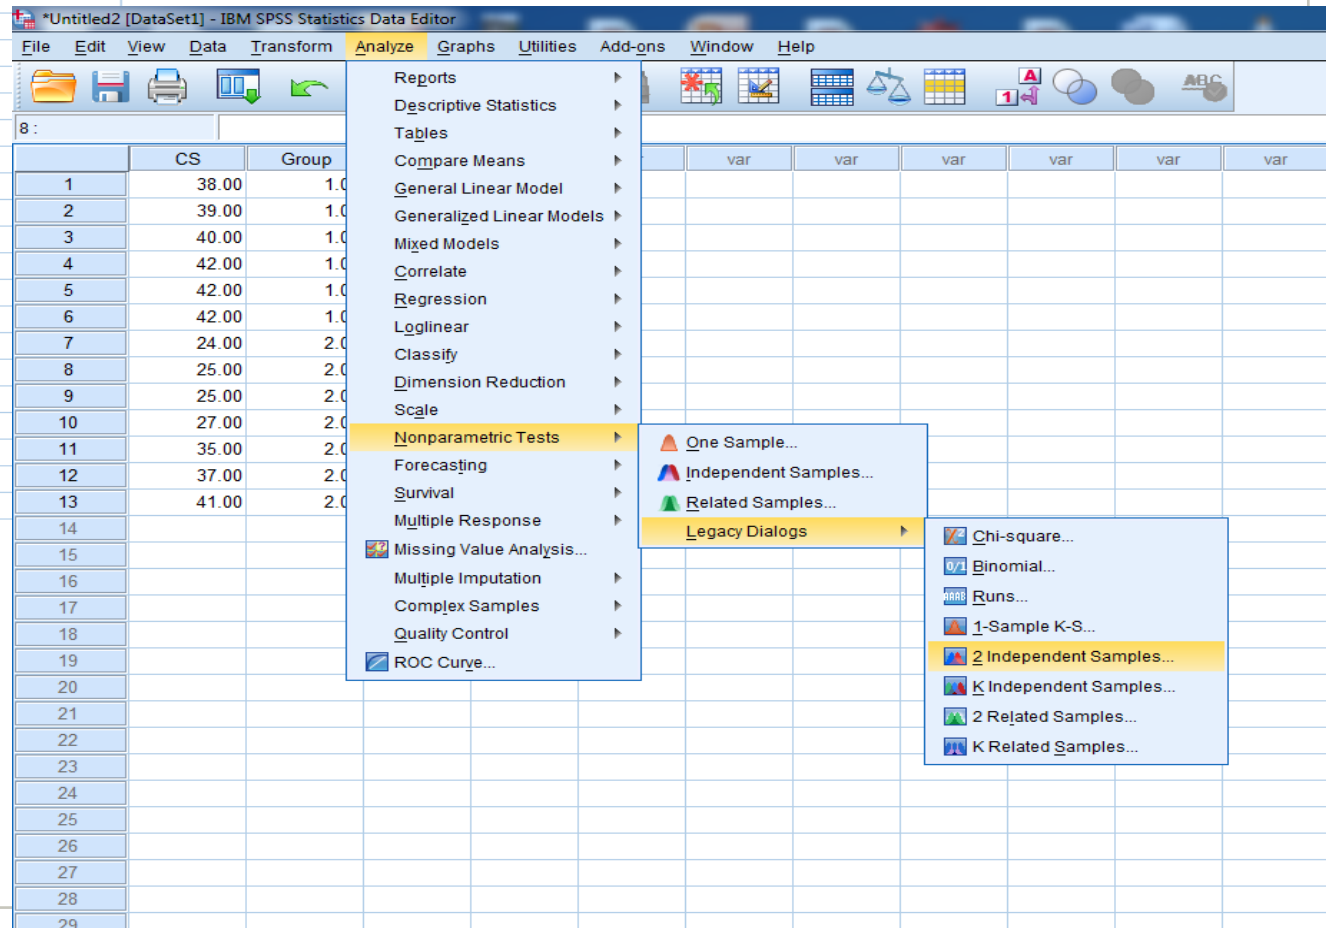

Mann-Whitney U test in SPSS software: contrast sensitivity data supplied in one column, another column for groups

The screenshot shows the SPSS Data Editor window with a dataset named '*Untitled2 [DataSet1]'. The data is organized into two columns: 'CS' and 'Group'. The 'CS' column contains numerical values ranging from 24.00 to 42.00, and the 'Group' column contains categorical values 1.00 and 2.00. Row 13 is highlighted in yellow, showing a CS value of 41.00 and a Group value of 2.00.

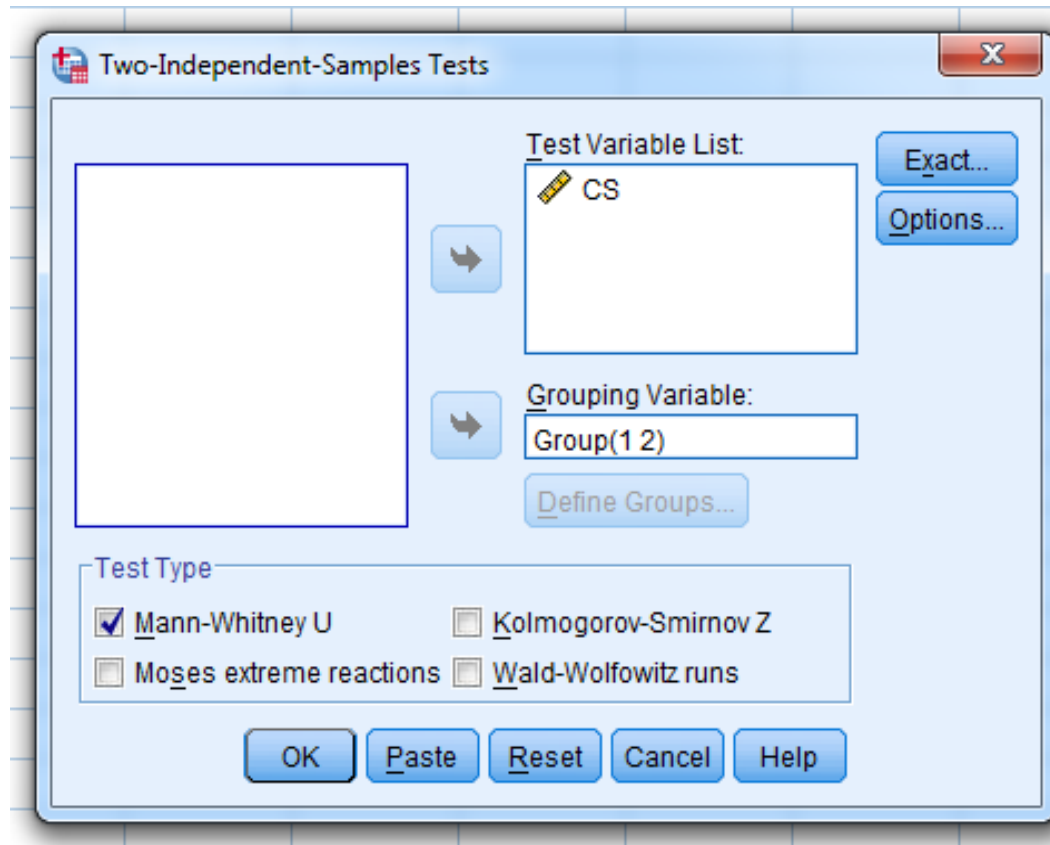

| | CS | Group |
|----|-------|-------|
| 1 | 38.00 | 1.00 |
| 2 | 39.00 | 1.00 |
| 3 | 40.00 | 1.00 |
| 4 | 42.00 | 1.00 |
| 5 | 42.00 | 1.00 |
| 6 | 42.00 | 1.00 |
| 7 | 24.00 | 2.00 |
| 8 | 25.00 | 2.00 |
| 9 | 25.00 | 2.00 |
| 10 | 27.00 | 2.00 |
| 11 | 35.00 | 2.00 |
| 12 | 37.00 | 2.00 |
| 13 | 41.00 | 2.00 |
| 14 | | |
| 15 | | |
| 16 | | |
| 17 | | |
| 18 | | |
| 19 | | |
| 20 | | |
| 21 | | |

The screenshot shows the SPSS Analyze menu with 'Nonparametric Tests' selected. The 'Legacy Dialogs' sub-menu is open, showing the '2 Independent Samples...' option highlighted. The '2 Independent Samples...' option is the correct choice for performing a Mann-Whitney U test on two independent groups.

Mann-Whitney U test in SPSS software: specification of variables for analysis

Note: Do not forget to define the group values!

Mann-Whitney test in SPSS software: asking for exact p-values when samples are small (i.e. both n_1 and n_2 are less than 20)

Note: the Asymptotic option is the default in SPSS, the Asymptotic option uses a simplified formula for calculation of p-value, and this formula works well if large enough data (>20).

Mann-Whitney Test

Mann-Whitney U test in SPSS software: results

Ranks

| | Group | N | Mean Rank | Sum of Ranks |
|----|--------|----|-----------|--------------|

a. Grouping Variable: Group

b. Not corrected for ties.

Conclusion?

Do we reject the null hypothesis of equality of CS distributions?

Mann-Whitney Test

Mann-Whitney U test in SPSS software: results

Ranks

| | Group | N | Mean Rank | Sum of Ranks |
|----|--------|----|-----------|--------------|
| CS | Normal | 6 | 10.00 | 60.00 |
| | DM | 7 | 4.43 | 31.00 |
| | Total | 13 | | |

Test Statistics^a

| | CS |
|--------------------------------|-------------------|
| Mann-Whitney U | 3.000 |
| Wilcoxon W | 31.000 |
| Z | -2.589 |
| Asymp. Sig. (2-tailed) | .010 |
| Exact Sig. [2*(1-tailed Sig.)] | .008 ^b |
| Exact Sig. (2-tailed) | .008 |
| Exact Sig. (1-tailed) | .004 |
| Point Probability | .002 |

a. Grouping Variable: Group

b. Not corrected for ties.

Conclusion?

Do we reject the null hypothesis of equality of CS distributions?

Answer is Yes, b/c
pvalue=0.008<0.05..

Summary

- When to use non-parametric tests for group comparisons?
 - When data are not Normal
 - Or when data too small checked normality
- If we want to compare more than 3 using a continuous independent data then we use Kruskal-Wallis test
 - If the test finds significant difference than we do post-hoc analyses using Wilcoxon test
 - Need to adjust for multiple comparisons.

Resources

Books

- Practical statistics for medical research by Douglas G. Altman
- Medical Statistics from Scratch by David Bowers

Journals' with series on how to do statistics in clinical research

- American Journal of Ophthalmology has **Series on Statistics**
- British Medical Journal has series **Statistics Notes**

Manual for SPSS statistical software - with lots of worked-out examples

- Andy Field, Discovering statistics using SPSS

Workshops organized by Biostatistics Department, U of Liverpool

<http://www.liv.ac.uk/translational-medicine/research/departmentsandgroups/biostatistics/coursesandworkshops/>

- 3 June 2013 [Statistical Process Control](#)
- 4 June 2013 [Validity and reliability of diagnostic tests and other methods of measurement](#)
- (Fall) [Unbiased design, error prediction and statistical analysis when quantifying biological structures](#)

Thank you for your attention

These slides and worksheet can be found on: <http://pcwww.liv.ac.uk/~czanner/>

Planned future workshops:

- How to diagnose if a patient is having a disease or how to determine if he is at high risk? Classification methods. (Spt/Oct)
- How to make sense of many measured characteristics? Multivariate stats methods.
- Odd-ratios: What are the odds of developing diseases in smokers as opposed to non-smokers?
- Ideas are welcome!

Statistical Clinics for ophthalmic clinicians and researchers !

Run by appointment.
